Surgical Pathology

Final Diagnosis:

THYROID, LEFT LOBE, RESECTION: THYROID GLAND WITH DIFFUSE LARGE
B-CELL LYMPHOMA, NONCLEAVED CELL TYPE, AND LYMPHOIDITIC
THYROIDITIS. [REDACTED]

Signed: [REDACTED]

(Electronic signature)

History:

The patient is a [REDACTED]-year-old female with a history of
Hashimoto's thyroiditis and left thyroid enlargement.

Source/Gross:

LEFT THYROID: Fresh tissue is received in a container labelled
[REDACTED] and designated "left thyroid". The
specimen is a lobe of thyroid gland measuring 5.5 x 3.5 x 2.0 cm
and weighing 18.8 gm. The capsular surface is pink and
glistening. The capsular surface was inked prior to sectioning,
and the parenchyma has a nodular tan to white appearance which
involves nearly the entire lobe, with only a few scattered areas
of residual maroon thyroid parenchyma. A frozen section was
performed.

FROZEN SECTION DIAGNOSIS: "Diagnostic material present".
Diagnosis rendered by [REDACTED] and reported to Dr.
[REDACTED]

The permanent section confirms the frozen section impression of
adequate diagnostic material.

The specimen is submitted as per the Lymphoma Study Group
Protocol:

Touch preps are made - 3.
Fixed in formalin for 24 hours - cassettes A1-A4.
Frozen in OCT for immunohistochemical studies - frozen section
block.
Placed sterily in medium for cytogenetics - 1 piece.
Frozen in foil for molecular diagnostic studies - 3 foil

These materials were examined by all those listed to establish the diagnosis with the signature being the responsible staff pathologist
