Gross Description:

1) The specimen is received fresh, labeled "total thyroidectomy" and consists of a thyroid weighing 20.5 g. The suture is in place by the surgeon to indicate the right lobe. The right lobe measures 4.5 x 3.5 x 2.5 cm, the left lobe measures 2.8 x 1.9 x 1.0 cm and the isthmus measures 2.5 x 0.5 x 0.3 cm. The external surface is covered by a thin fibrous capsule. The posterior surface of the specimen is inked black, and the anterior is inked blue. Sectioning reveals a nodule in the right lobe that measures 2.8 x 2.5 x 2.2 cm. The nodule is partially solid and partially cystic. The solid area is fleshy and brown and has a calcified center. The left lobe contains a well-circumscribed, solid nodule that measures 1.0 x 0.6 x 0.6 cm. The remaining thyroid parenchyma is red tan and beefy. Representative sections of the specimen have been submitted for TPS, and a photograph has been taken. The remaining tissue is serially sectioned and entirely submitted. A section with calcifications is decalcified prior processing.

Summary of sections:

RNC-- right thyroid lobe nodule with calcification

RL - right lobe

LL - left lobe

IS - isthmus

2) The specimen is received in formalin labeled "Pretracheal tissue" and consists of a 0.5 x 0.4 x 0.3 cm piece of fatty soft tissue. The specimen is entirely submitted.

Summary of sections:

U - undesignated

3) The specimen is received in formalin labeled "Right paratracheal nodes" and consists of a 1.1 x 1.1 x 0.3 cm piece of tan soft tissue. The specimen is entirely submitted.

Summary of sections:

LN - lymph nodes
